Intersection Control Evaluation

TH 23 at CSAH 5 / CSAH 15

Prepared for the Kandiyohi County in cooperation with the Minnesota Department of Transportation (MnDOT) District 8.

1.0 Background and Description of Location

Kandiyohi County is interested in improvements at the intersections in the area of Minnesota Highway 23 (TH 23) and County State Aid Highway 5/15 (CSAH 5/15). The existing at-grade intersection had a significant number of crashes in recent years and became an intersection of concern. In 2014, MnDOT conducted a Highway Safety Improvement Project (HSIP) to reduce the number of vehicle conflict points in an effort to decrease the number of crashes at the intersection.

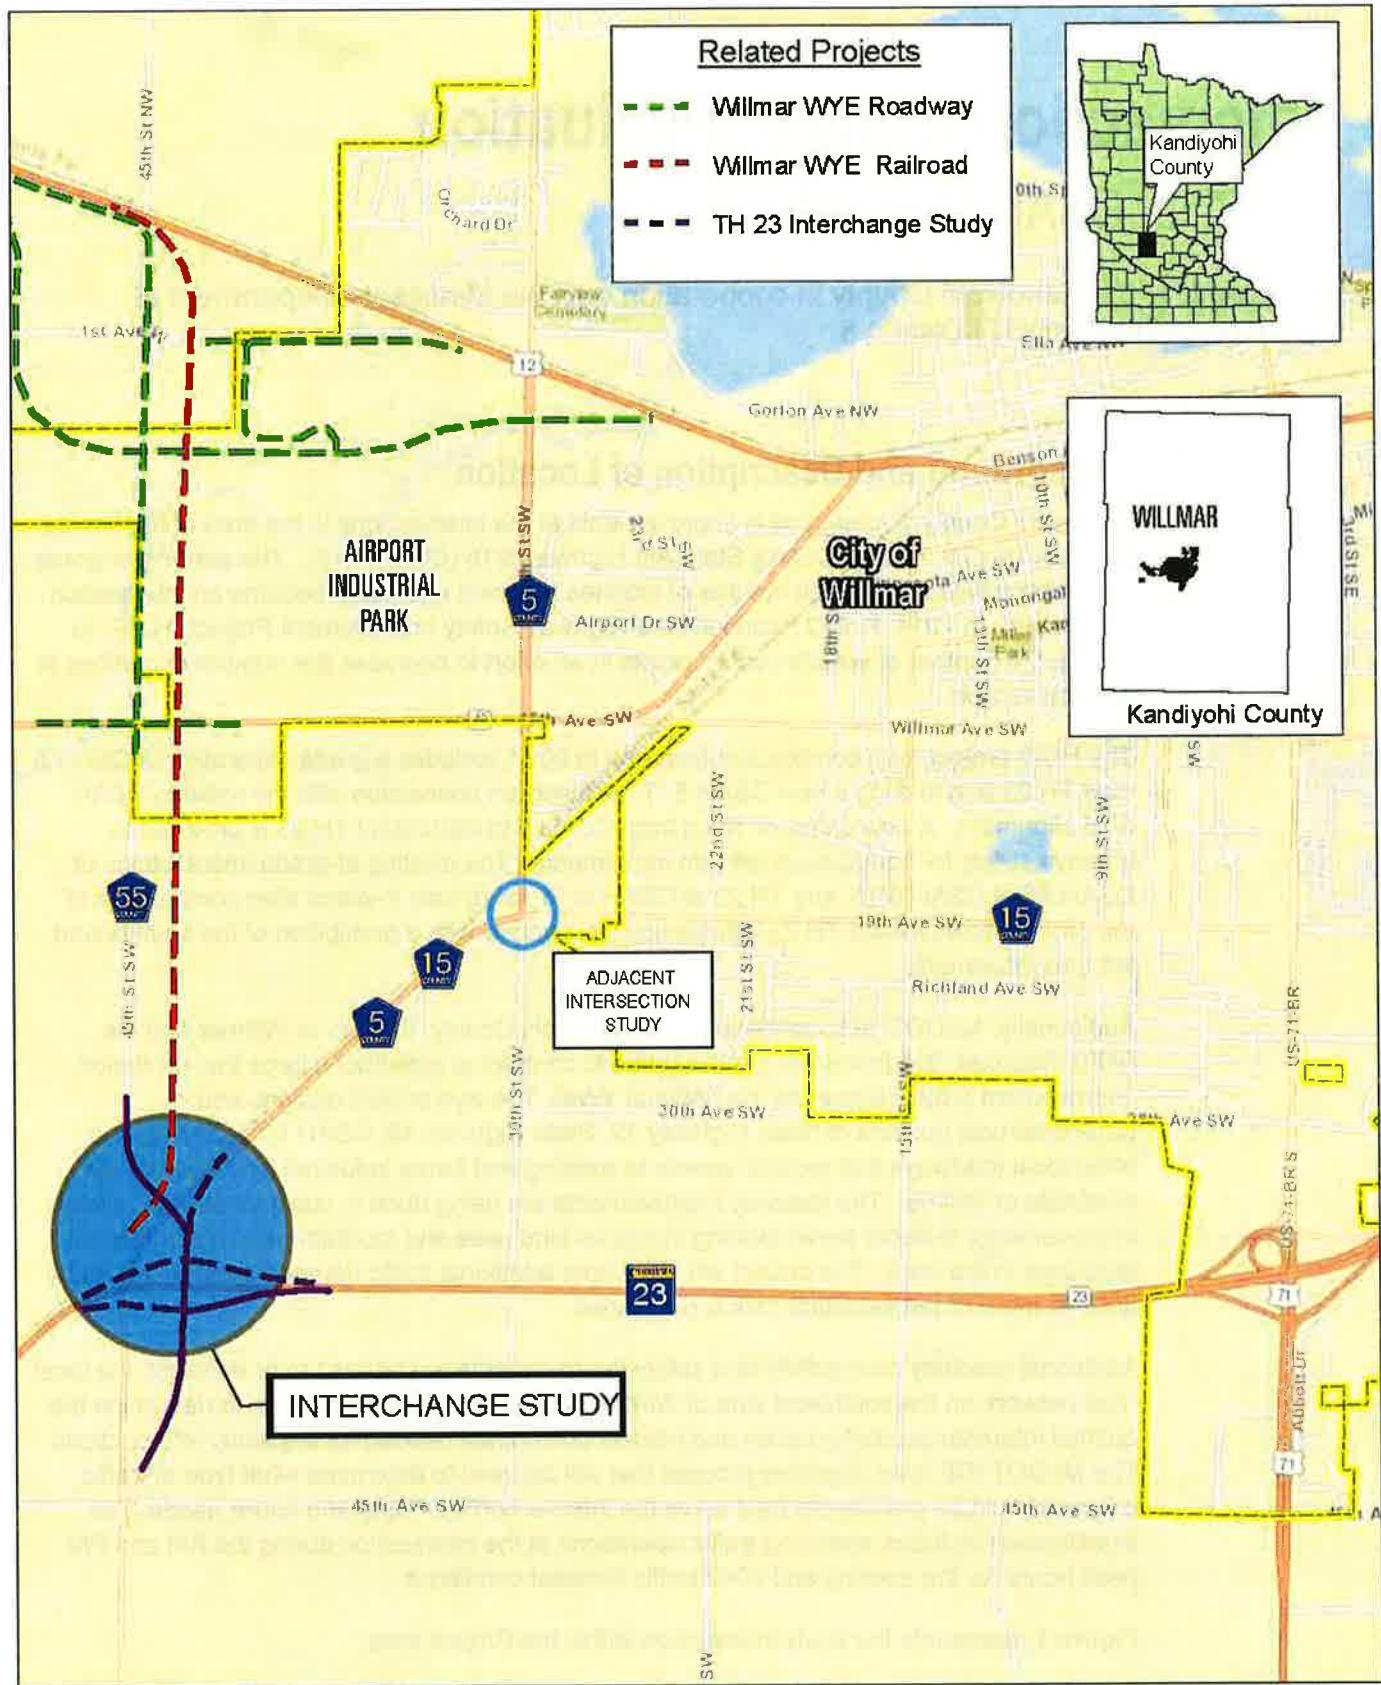

The HSIP project, with construction finalizing in 2017, includes a grade separation of CSAH 5 over TH 23 and making a new CSAH 5 "T" intersection connection with the existing CSAH 5/15 alignment. A new entrance ramp from CSAH 5 to eastbound TH 23 is provided to improve safety for southbound left turn movements. The existing at-grade intersections of CSAH 55 at CSAH 5/15, and TH 23 at CSAH 5/15 will remain in-place after construction of the project; however the TH 23 intersection will operate with a prohibition of the southbound left turn movement.

Additionally, MnDOT, in coordination with Kandiyohi County, the City of Willmar and the BNSF Railroad, is administering a design/build contract to construct a large transportation improvement project known as the "Willmar Wye". The wye project realigns and or/reconstructs portions of State Highway 12, State Highway 40, CSAH 55, CSAH 5, and other local roadways that provide access to existing and future industrial land uses on the west side of Willmar. The roadway improvements are being done in conjunction with railroad improvements to better serve existing industrial land uses and facilitate growth of industrial land uses in the area. The project will likely spur additional traffic demand through this study area as more of the industrial park is developed.

Additional roadway connectivity and safety improvements are needed to re-establish the local road network on the southwest side of Willmar. The purpose of this study is to determine the optimal interchange configuration and intersection control needed for the study intersections. The MnDOT ICE is an objective process that will be used to determine what type of traffic control should be provided to best serve the intersection's existing and future needs. The investigation includes analyzing traffic operations at the intersection during the AM and PM peak hours for the existing and 2040 traffic forecast conditions.

Figure 1 represents the study intersection within the Project area.

Figure 1 – Location Map

2.0 Existing Conditions

Currently, CSAH 5 is a north-south, Major Collector that extends through the west side of Willmar, Minnesota and spans all of Kandiyohi County. Through the project area, CSAH 5 has a single lane in each direction and a posted speed limit of 55 mph.

Trunk Highway 23 (TH 23) is a Principal Arterial that extends between Interstate 90 at the southwest end to Duluth at the northeast end, spanning a majority of the state. TH 23 through the project area runs east-west along the south side of Willmar with a single lane in each direction and a posted speed limit of 60 mph. Approximately 2 miles east of the project area TH 23 is expanded to a 4-lane divided freeway.

There are two existing intersections under consideration in the study area along CSAH 5.

- CSAH 5 at TH 23 (Prior to 2017 HSIP Project - see Note below)
 - Two-way stop control with TH 23 operating freely
 - Northbound approach had a single lane for all movements
 - Southbound approach has a shared through/left turn lane and a dedicated right turn lane
 - Westbound approach has a single through lane and dedicated right and left turn lanes
 - Eastbound approach has a single through lane and dedicated right and left turn lanes

Note: The 2017 HSIP project realigned CSAH 5 on a new bridge over TH 23, and rerouted southbound left turns, northbound left turns, westbound left turns and eastbound right turns.

- CSAH 5 at CSAH 55
 - Stop control on CSAH 55 with CSAH 5 operating freely
 - Northbound approach has a shared through/left turn lane and a left turn bypass lane
 - Southbound approach has a single through lane and a dedicated right turn lane
 - Eastbound approach has dedicated right and left turn lanes

Spacing between the two intersections is relatively close with approximately 475 feet of roadway between the intersections and 400 feet of useable storage.

2.1 Crash History

Crash data from January 1, 2011 through December 31, 2015 was obtained from MnDOT's crash mapping analysis software (MnCMAT). The type and severity of crashes were reviewed and the crash rate and critical rate was calculated for each study intersection. The crash information is summarized in **Table 1**. Crash diagrams can be found in **Appendix A**.

Crash rates are expressed as number of crashes per million entering vehicles (MEV) at the intersection. The critical crash rate is a statistical value that is unique to each intersection and is based on vehicular exposure and the statewide average crash rate for similar intersections. An intersection with a crash rate higher than the critical rate indicates a sustained crash problem at the intersection.

Crash severity is separated into five categories based on injuries sustained during the crash.

- Fatal – Crash that results in a death
- Severity A – Crash that results in an incapacitating injury
- Severity B – Crash that results in a non-incapacitating injury
- Severity C – Crash that results in possible injury
- Property Damage – Crash that results in property damage only, with no injuries

Table 1
Crash History 2011-2015

Intersection	Crash Severity					Crash Rates	
	Fatal and Severity A	Severity B	Severity C	Property Damage	Total	Intersection Rate	Critical Rate
CSAH 5 at TH 23	0	2	2	6	10	0.77	0.65
CSAH 5 at CSAH 55	0	0	0	4	4	0.55	0.80

The intersection of CSAH 5 at TH 23 has experienced 10 crashes during the 5-year analysis period and has a crash rate that is above the calculated critical rate, indicating a sustained crash problem at this intersection. Four of the 10 crashes were right angle crashes and an additional two crashes involved left turning vehicles. Three of the crashes involved southbound vehicles in rear-end type collisions.

The intersection of CSAH 5 at CSAH 55 has experienced 4 crashes during the 5-year analysis period and has a crash rate that is below the critical rate, indicating that the intersection does not have a crash problem.

2.2 Existing Traffic Demands

A 13-hour (6 a.m. to 7 p.m.) intersection turning movement count was performed in May of 2017 prior to the completion of the HSIP project. Passenger vehicles, heavy commercial vehicles (trucks), pedestrians, and bicyclists were counted.

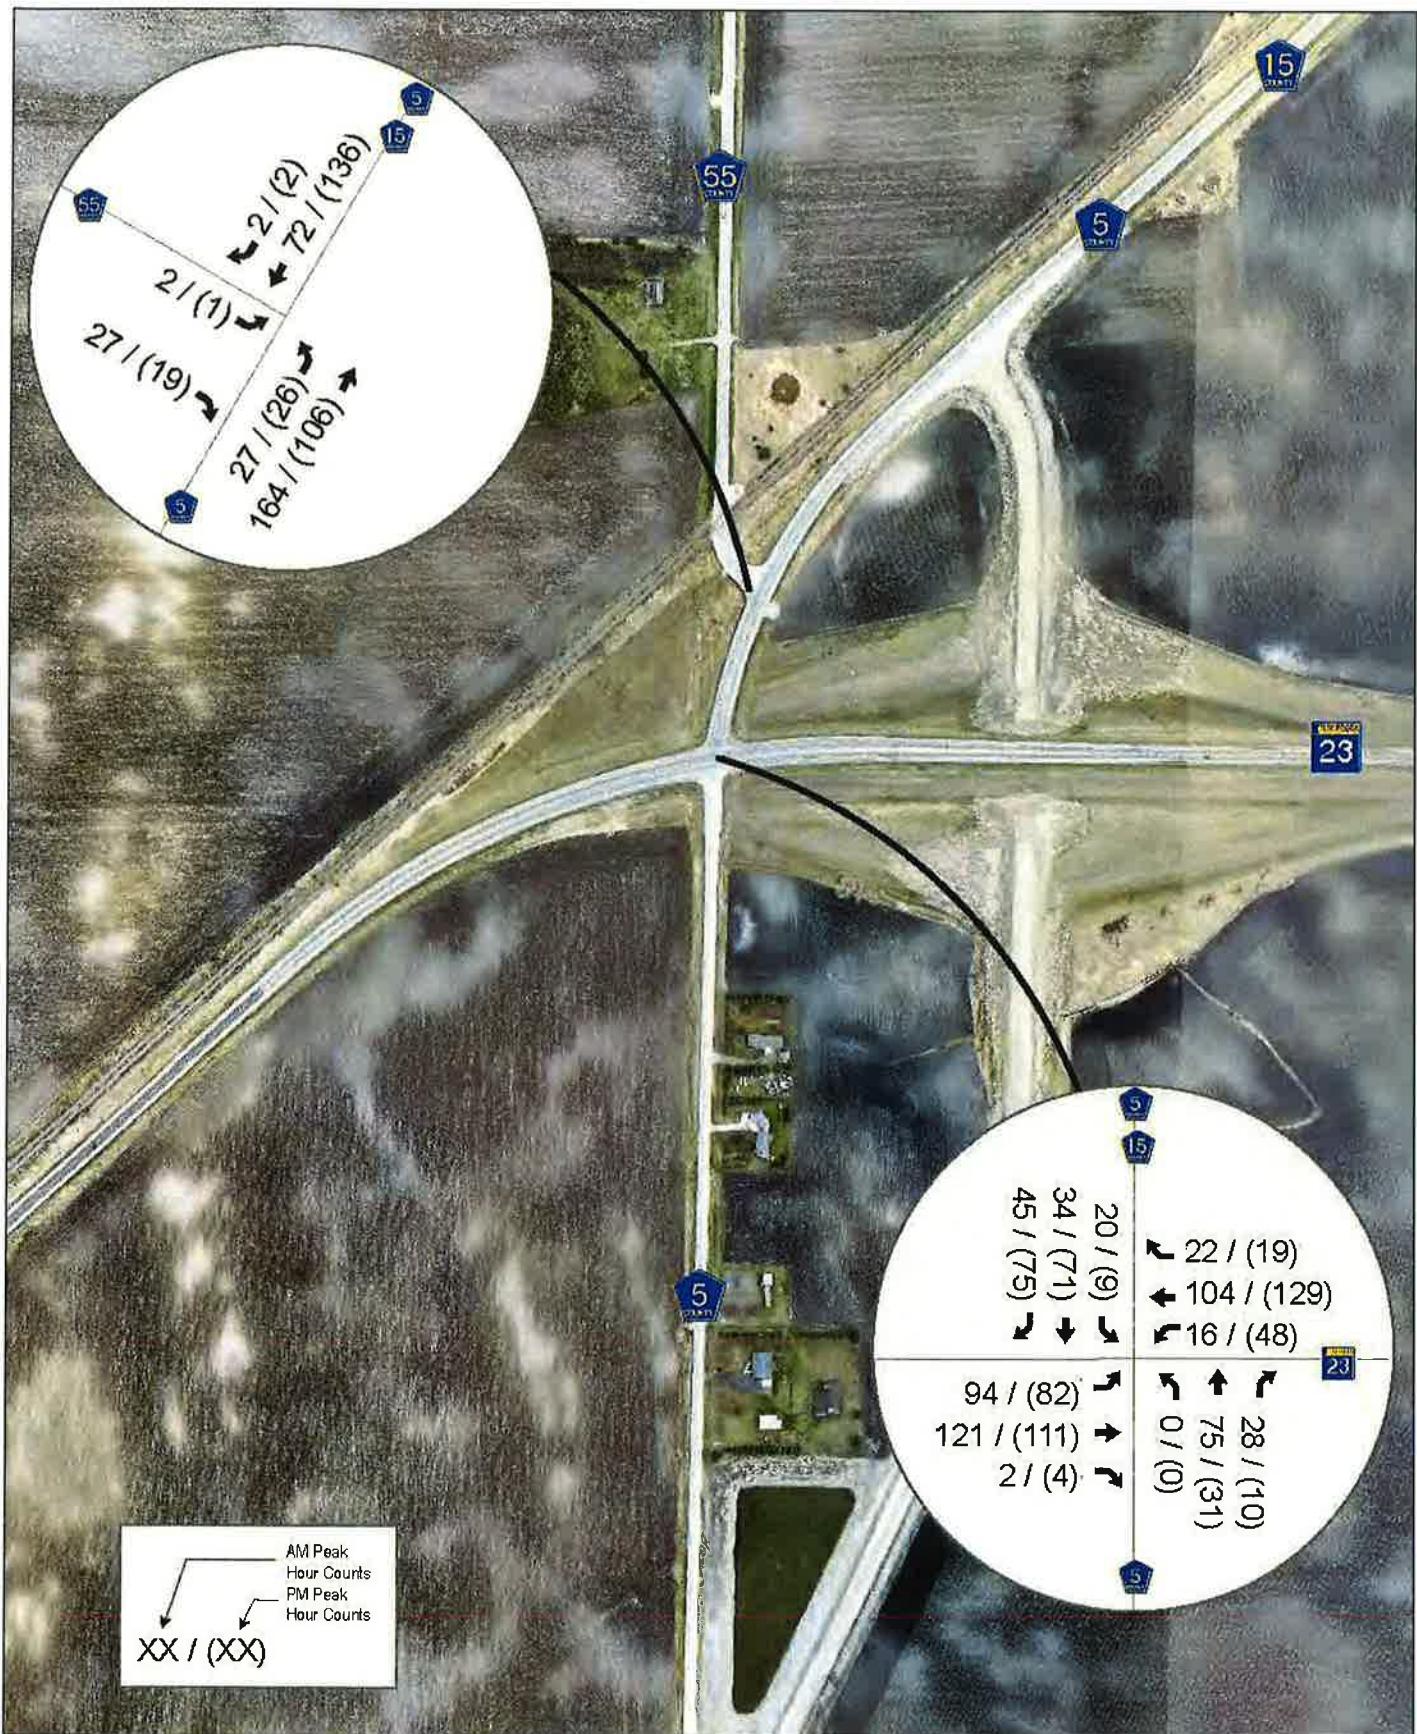

The 13-hour intersection volumes include approximately 15% trucks (15% a.m., 9% p.m.). The existing 2017 vehicular turning movements are shown in **Figure 2**.

Average Annual Daily Traffic (AADT) from MnDOT traffic flow maps includes the most current AADT from 2014. The AADT for each approach for each intersection is shown in **Table 2**.

Table 2
Existing Traffic Demands AADT

Intersection	Intersection Leg	Roadway	AADT
CSAH 5 at TH 23	East	TH 23	3,900
	West	TH 23	5,700
	South	CSAH 5	1,200
	North	CSAH 5	3,400
CSAH 5 at CSAH 55	West	CSAH 55	940
	South	CSAH 5	3,400
	North	CSAH 5/CSAH 15	3,550

Figure 2 – 2017 Existing Peak Hour Turning Movement Volumes

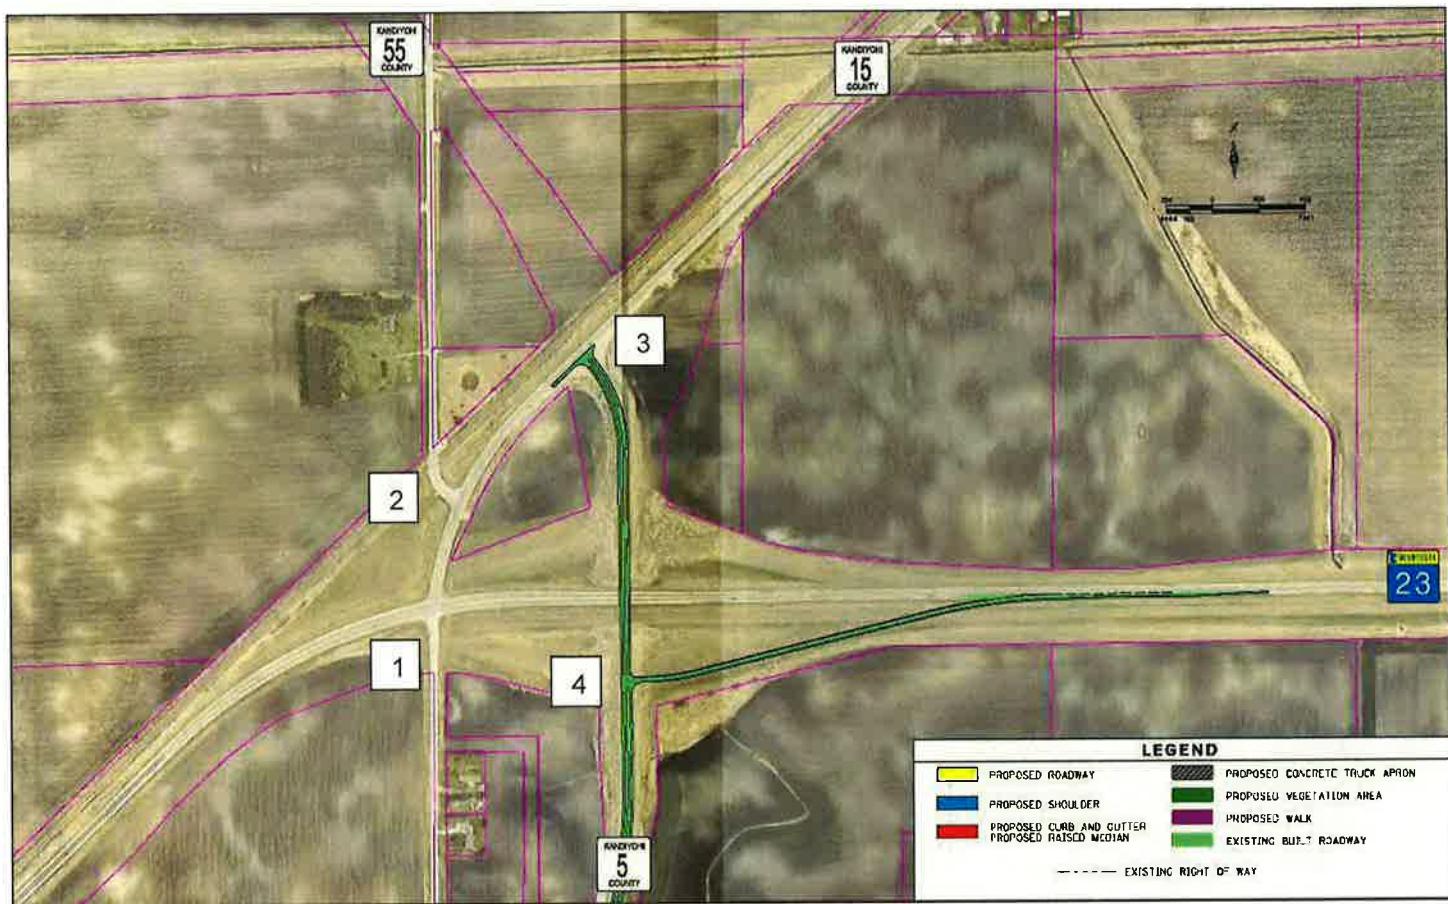

3.0 Future Conditions

A new CSAH 5 Bridge that passes over TH 23 was constructed and opened to traffic in 2017. The bridge project included an entrance ramp to eastbound TH 23 and removal of the south at grade leg which was rerouted over the bridge. In addition, the southbound left turn movement will be prohibited and replaced by the new entrance ramp.

For the purpose of this report, the newly constructed geometric configuration will be considered both the "2017 Build" and "2040 No Build" alternatives. For the purposes of warrant, safety, and operational analysis, the 2017 Build configuration is required to show the benefits from the HSIP project compared to the existing conditions. However, in the 2040 forecast year, the HSIP project is considered to be the No Build alternative as it would have been in place for over 20 years.

A layout of the newly constructed CSAH 5 Bridge is shown in **Figure 3**; a full layout can be found in **Figure 6** in **Appendix B**.

Figure 3 – 2017 HSIP Project: CSAH 5 Bridge Layout

The 2017 Build/2040 No Build configuration consists of two new intersections, the modification of one of the existing intersections, and one existing intersection along CSAH 5. The intersections are numbered in Figure 3 to correspond with the following descriptions.

- **1. CSAH 5 at TH 23 (Modified Existing Intersection)**
 - Southbound approach has a dedicated right turn lane
 - Westbound approach has a single through lane and a dedicated right turn lane
 - Eastbound approach has a single through lane and a dedicated left turn lane
- **2. CSAH 5 at CSAH 55 (Existing Intersection)**
 - Northbound approach has a shared through/left turn lane and a left turn bypass lane
 - Southbound approach has a single through lane and a dedicated right turn lane
 - Eastbound approach has dedicated right and left turn lanes
- **3. CSAH 5 at New CSAH 5 (New Intersection north of bridge)**
 - Northbound approach has a single through lane and a dedicated right turn lane
 - Southbound approach has a shared through/left turn lane and a left turn bypass lane
 - Westbound approach has dedicated left and right turn lanes
- **4. CSAH 5 at TH 23 Eastbound Entrance Ramp (New Intersection)**
 - Northbound approach has a single through lane and a dedicated right turn lane
 - Southbound approach has a shared through/left turn lane
 - The east leg is an on ramp to eastbound TH 23 so there are no lanes of approach

3.1 Traffic Forecasts

Traffic forecasts were developed based on historical trends in the roadway AADT, gathered from MnDOT traffic flow maps. **Table 3** represents the historical AADT demands within the project area between 1994 and 2014.

A regression analysis was done to provide information for the expected growth rate; the resultant growth rates ranged from 0% to 2% per year. These values were then compared to the "Willmar Wye" traffic forecasts prepared as part of that study.

Based on the comparison of the available data and agency input, an assumed growth rate of 1% per year was used for all roadways except CSAH 55, which had an assumed growth rate of 3.6% per year due to expected industrial park development growth spurred by the "Willmar Wye" project.

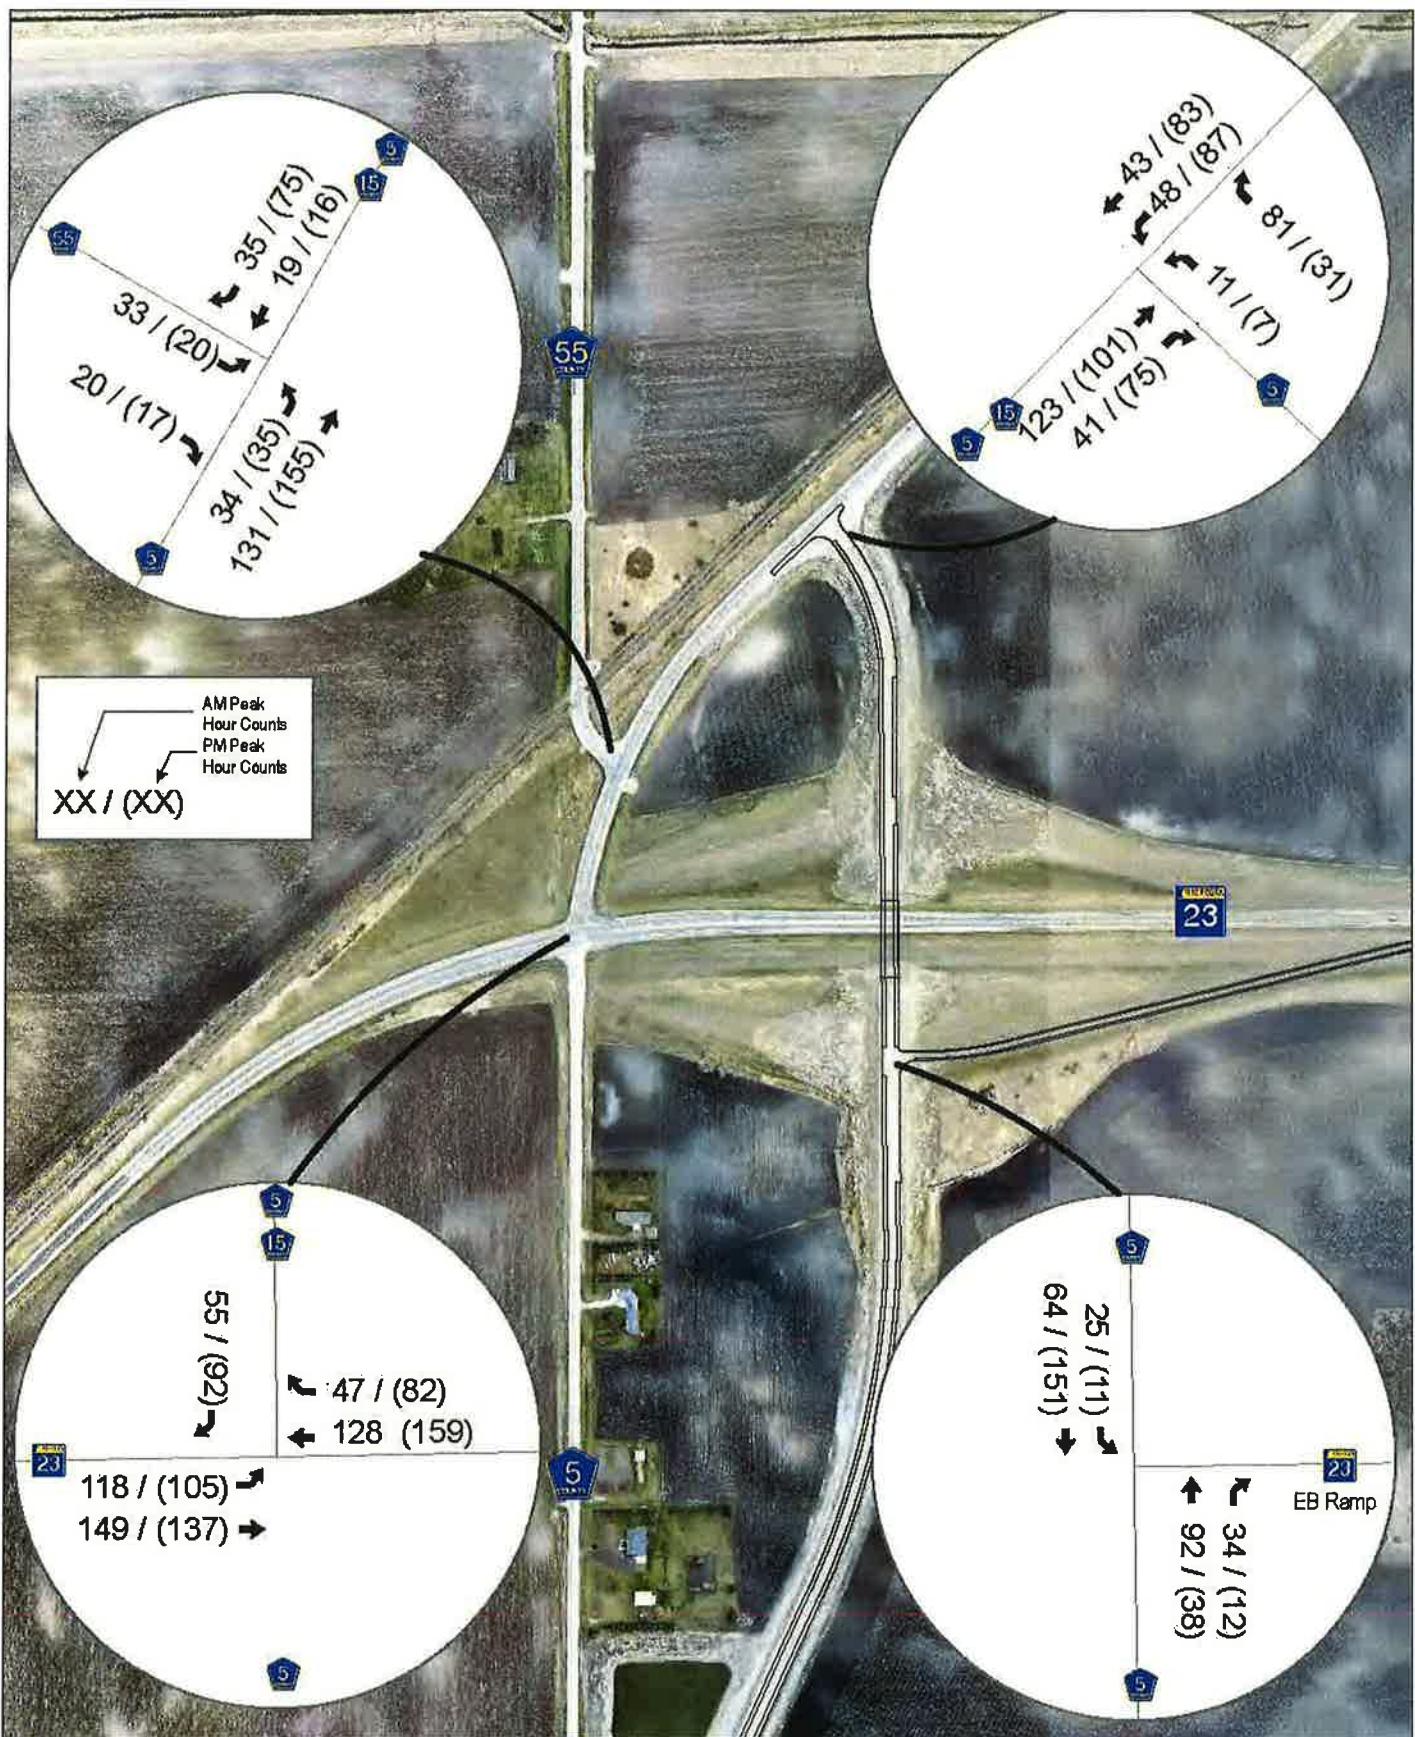

Table 3
Historical and Forecast Traffic Demands AADT

Route	Description	1994	1998	2002	2006	2010	2014	2040 Forecast
TH 23	West of CSAH 5	4,500	4,950	5,100	5,000	5,600	5,700	7,200
TH 23	East of CSAH 5	2,000	2,350	2,250	2,150	4,000	3,900	4,900
CSAH 5	South of TH 23	830	1,350	1,550	1,350	1,250	1,200	1,500
CSAH 5	TH 23 to CSAH 55	n/a	n/a	n/a	n/a	2,350	3,400	4,300
CSAH 55	North of CSAH 5	840	1,150	980	1,150	830	940	1,830
CSAH 5/CSAH 15	CSAH 55 to CSAH 5	3,500	4,100	3,750	3,500	3,800	3,550	4,450

Using the linear growth rates of 1% per year for all roadways, with the exception of CSAH 55 (3.6%), future turning movement volumes were estimated for the 2040 design year based on the 2017 Build configuration for the CSAH 5 HSIP project.

For the other CSAH 5 interchange alternatives, trips were rerouted based on the alternative intersection designs and then growth rates were applied to estimate 2040 traffic demands. The future turning movement volumes for the 2040 No Build configuration can be found in **Figure 4**.

Figure 4 – 2040 Peak Hour Turning Movement Volumes (2017 Build Configuration)

4.0 Analysis of Alternatives

In addition to the 2040 No Build alternative, five other CSAH 5 Interchange configurations were analyzed as part of this project.

The 2017 HSIP construction project will leave a high speed, at-grade intersection in place along TH 23 and provide only a partial interchange. This design may be confusing for non-local traffic, especially heavy vehicle traffic destined to the many industrial land uses to the north.

The intent of the additional interchange alternative designs, set forth by the county, is to address the following objectives:

- Provide an effective westerly bypass
- Provide good access to the industrial land uses
- Clarity of use for driving public
- Cost effective solutions

4.1 CSAH 5 Interchange Alternatives

This section will describe the five build alternatives considered in this study. Alternatives 1, 2, and 3 are considered to be a 2-phase projects for the long term vision of the project area; while Alternatives 4 and 5 would need to be completed in a single phase.

Kandiyohi County has a long term plan to grade separate CSAH 55 over the BNSF railroad to enhance its effectiveness as a westerly bypass route. The railroad grade separation is considered Phase 2 for Alternatives 1 through 3; however it would be considered part of the initial project for both Alternatives 4 and 5 because it is integral to the connectivity of ramps to and from TH 23.

Full layouts of each of the CSAH 5 Interchange alternatives can be found in **Appendix B**. In Alternatives 1, 2, and 3, each layout includes the future Phase 2 configuration.

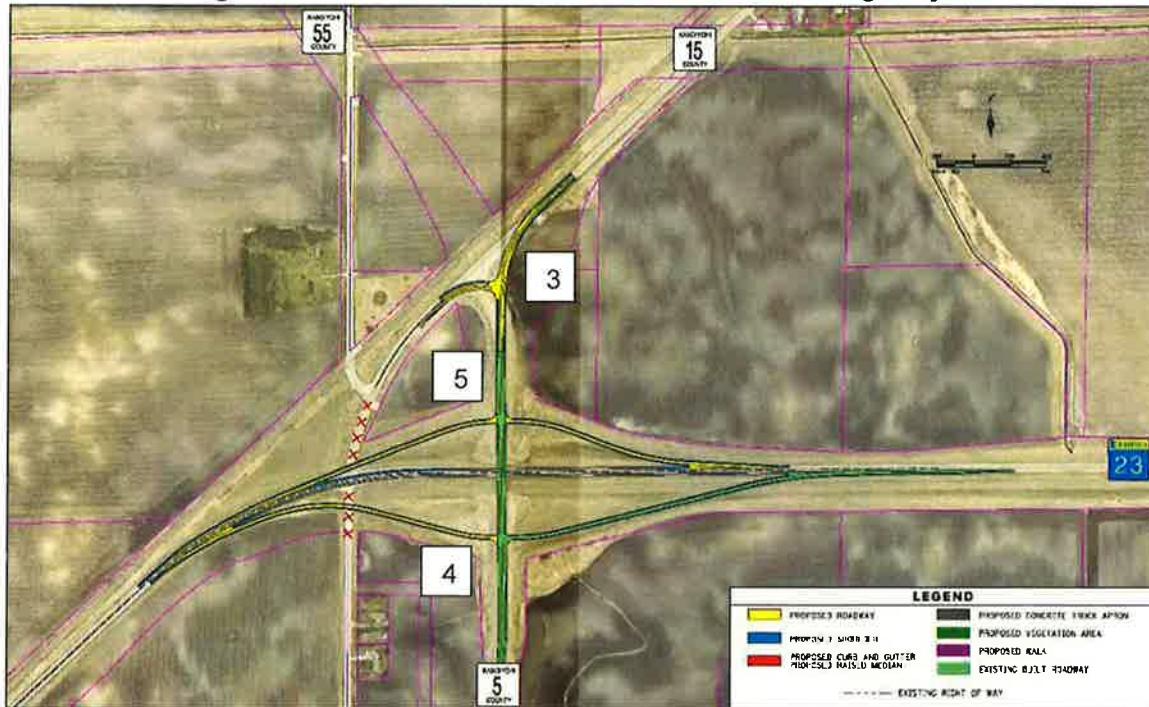

4.1.1 Alternative 1 - Standard Diamond Interchange

Alternative 1 is configured as a standard diamond interchange with ramps to and from eastbound and westbound TH 23. In alternative 1, CSAH 55 follows part of the existing CSAH 5/CSAH 15 before connecting to the new CSAH 5 alignment.

The three new proposed ramp connections to TH 23 utilize right of way and rough grading that is already established. As depicted in the Appendix B drawing, the estimated Phase 1 cost for this alternative is approximately \$3.5 million (2019 dollars, including engineering and CA). Phase 2 costs would be approximately \$7.1M.

This design allows for free flow of traffic moving through the study area along CSAH 5, which is the predominant movement. The Alternative 1- Standard Diamond Interchange layout is depicted in **Figure 5**.

Figure 5 – Alternative 1 - Standard Diamond Interchange Layout

Alternative 1 consists of three modified or new intersections to achieve the standard diamond interchange configuration. The intersections are numbered in Figure 5 to correspond with the following descriptions.

- **3. CSAH 5 at CSAH 55 (New Intersection)**
 - Northbound approach has a shared through/left turn lane and a left turn bypass lane
 - Southbound approach has a single through lane and a dedicated right turn lane
 - Eastbound approach has dedicated right and left turn lanes
- **4. CSAH 5 at TH 23 Eastbound Ramps (Modified Intersection)**
 - Northbound approach has a single through lane and a dedicated right turn lane
 - Southbound approach has a shared through/left turn lane
 - Westbound approach is an on ramp to eastbound TH 23 so there are no lanes of approach
 - Eastbound approach has a shared through/left turn lane and a dedicated right turn lane (EB TH 23 Exit Ramp)
- **5. CSAH 5 at TH 23 Westbound Ramps (New Intersection)**
 - Northbound approach has a shared through/left turn lane
 - Southbound approach has a single through lane and a dedicated right turn lane
 - Westbound approach has a shared through/left turn lane and a dedicated right turn lane (WB TH 23 Exit Ramp)
 - Eastbound approach is an on ramp to westbound TH 23 so there are no lanes of approach

4.1.2 Alternative 2 - Folded Diamond Interchange A

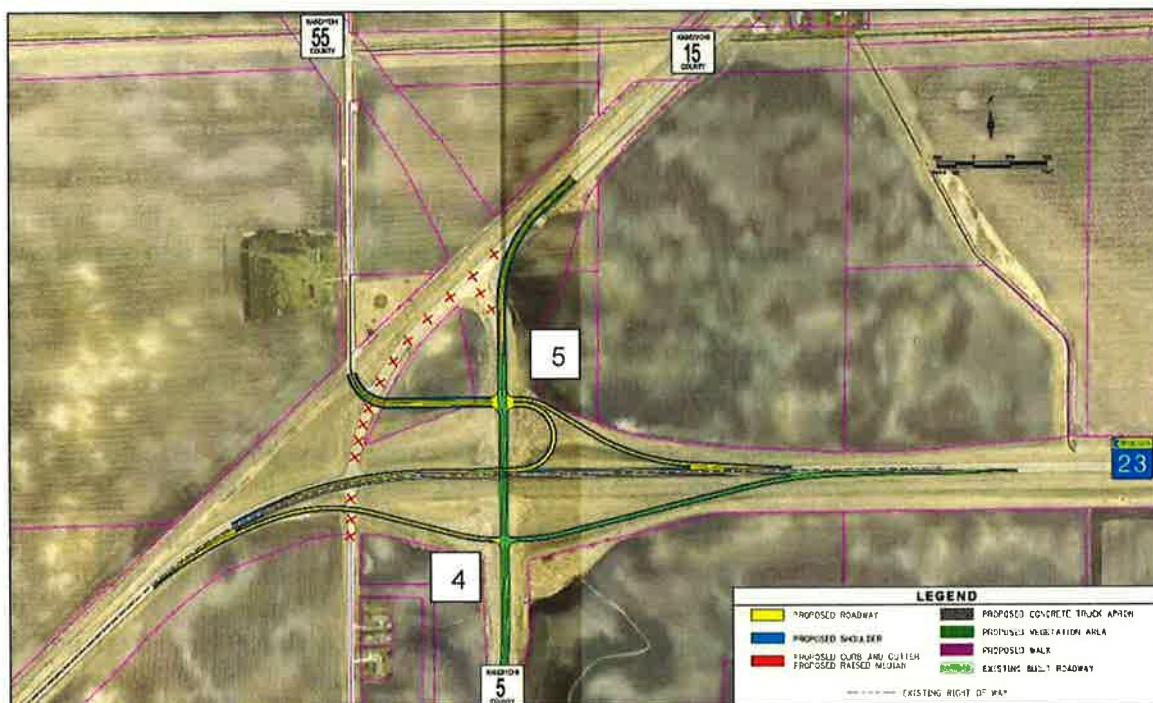

Alternative 2 utilizes a partially folded diamond interchange where the ramps to and from westbound TH 23 are both on the east side of CSAH 5. The ramps to and from eastbound TH 23 have the same configuration as the standard diamond alternative.

The majority of the new proposed ramp connections to TH 23 already have the right of way space and grading on the alignments; however modifications to accommodate the loop configuration will require additional right of way. As depicted in the Appendix B drawing, the estimated Phase 1 cost for this alternative is approximately \$3.8 million (2019 dollars, including engineering and CA). Phase 2 costs are approximately \$7.1M.

In Alternative 2, CSAH 55 is extended so that it connects directly to the CSAH 5 north ramp intersection. Alternative 2 allows for free flow of traffic moving through the study area along CSAH 5, while also reducing the total number of intersections within the network.

The Alternative 2- Folded Diamond Interchange A layout can be found in **Figure 6** below.

Figure 6 – Alternative 2 - Folded Diamond Interchange A Layout

Alternative 2 consists of one completely new intersection and the modification of one of the existing intersections from the 2017 Build configuration along CSAH 5. The intersections are numbered in Figure 6 to correspond with the following descriptions.

- **4. CSAH 5 at TH 23 Eastbound Ramps (Modified Intersection)**
 - Northbound approach has a single through lane and a dedicated right turn lane
 - Southbound approach has a shared through/left turn lane
 - Westbound approach is an on ramp to eastbound TH 23 so there are no lanes of approach
 - Eastbound approach has a shared through/left turn lane and a dedicated right turn lane (EB TH 23 Exit Ramp)

- **5. CSAH 5 at TH 23 Westbound Ramps (New Intersection)**
 - Northbound approach has a single lane for all movements
 - Southbound approach has a shared through/left turn lane and a dedicated right turn lane
 - Westbound approach has a shared through/left turn lane and a dedicated right turn lane (WB TH 23 Exit Ramp)
 - Eastbound approach has a shared through/left turn lane and a dedicated right turn lane (CSAH 55 Approach)

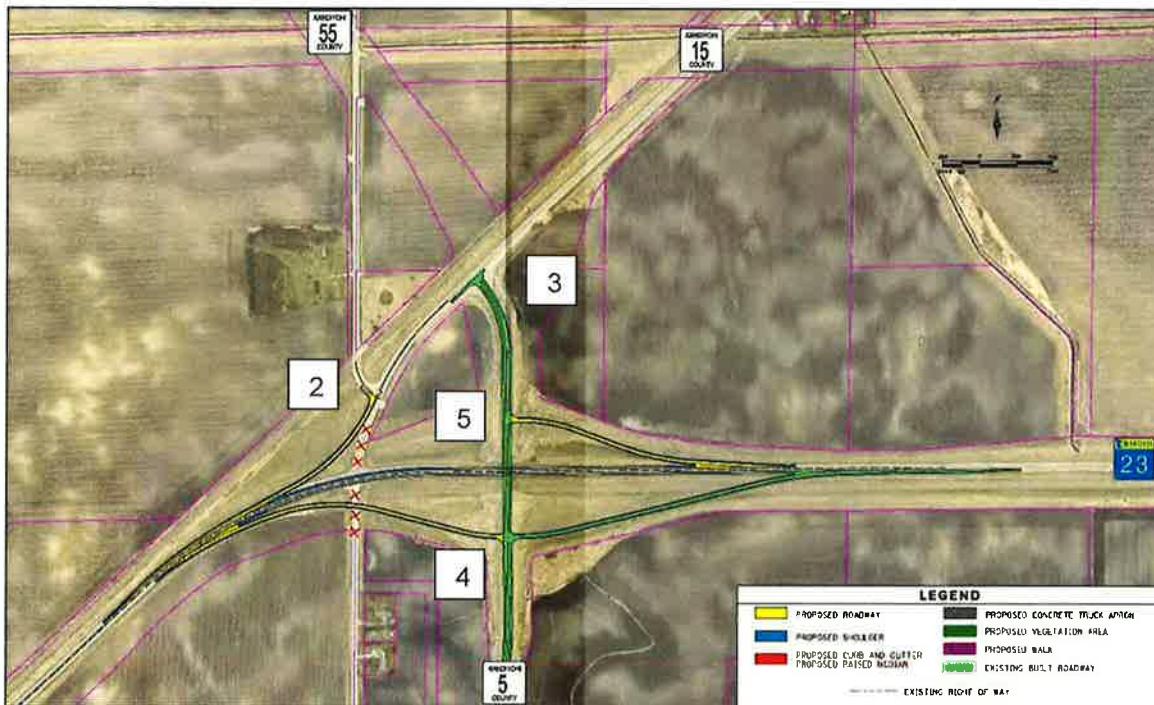

4.1.3 Alternative 3 - Modified Diamond Interchange

Alternative 3 is a modified diamond interchange where the entrance ramp to westbound TH 23 starts at the existing intersection of CSAH 5 at CSAH 55. The off ramp from westbound TH 23 and both the on and off ramps to and from eastbound TH 23 have the same standard diamond configuration as Alternative 1.

The three new proposed ramp connections to TH 23 already have the right of way space and grading on the majority of the alignments. This alternative would not provide modifications to allow CSAH 5 to be a continuous roadway and could leave the T-intersection in place as shown or realign the T to make the CSAH 5 the predominant roadway. As depicted in the Appendix B drawings the estimated Phase 1 cost for this alternative is approximately \$3.4 million (2019 dollars, including engineering and CA). Phase 2 costs are approximately \$7.8 million.

The Alternative 3 - Modified Diamond Interchange layout is shown in **Figure 7** below.

Figure 7 – Alternative 3 - Modified Diamond Interchange Layout

Alternative 3 consists of one completely new intersection, the modification of two of the existing intersections from the 2017 Build configuration, and one existing intersection from the 2017 Build configuration along CSAH 5. The intersections are numbered in Figure 7 to correspond with the following descriptions.

- **2. CSAH 5 at CSAH 55/TH 23 Westbound Entrance Ramp (Modified Intersection)**
 - Northbound approach is an on ramp to westbound TH 23 so there are no lanes of approach
 - Southbound approach has a single through turn lane and a dedicated right turn lane
 - Eastbound approach has dedicated left and right turn lanes
- **3. CSAH 5/15 at New CSAH 5 (Existing Intersection north of bridge)**
 - Northbound approach has a shared through/left turn lane and a left turn bypass lane
 - Southbound approach has a single through lane and a dedicated right turn lane
 - Westbound approach has dedicated left and right turn lanes
- **4. CSAH 5 at TH 23 Eastbound Ramps (Modified Intersection)**
 - Northbound approach has a single through lane and a dedicated right turn lane
 - Southbound approach has a shared through/left turn lane
 - Westbound approach is an on ramp to eastbound TH 23 so there are no lanes of approach
 - Eastbound approach has a shared through/left turn lane and a dedicated right turn lane
- **5. CSAH 5 at TH 23 Westbound Ramps (New Intersection)**
 - Northbound approach has a shared through/right turn lane
 - Southbound approach has a shared through/left turn lane
 - Westbound approach has dedicated left and right turn lanes

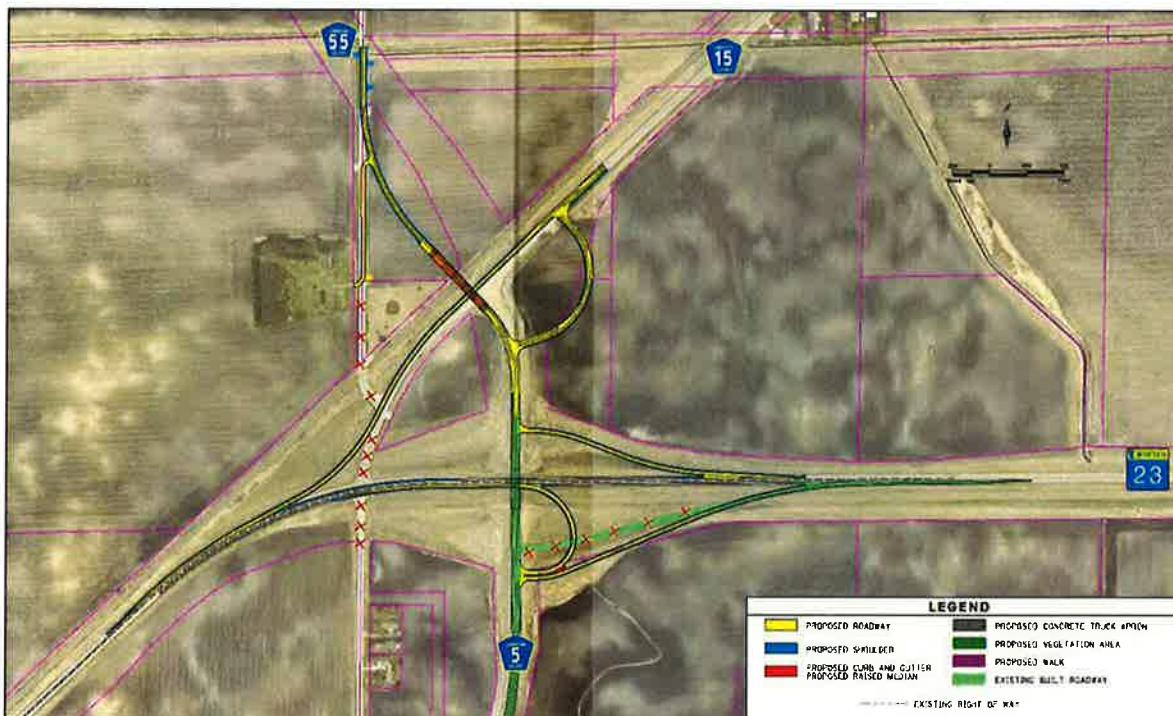

4.1.4 Alternative 4 - Folded Diamond Interchange B

Alternative 4 utilizes a partially folded diamond interchange where the ramps to and from eastbound TH 23 are on the east side of CSAH 5. The off ramp from westbound TH 23 is the same as in the standard diamond interchange configuration, however, the on ramp to westbound TH 23 follows the existing CSAH 5 alignment. The recently constructed southern TH 23 ramp terminal intersection would also need to be relocated in order to accommodate the folded diamond design.

Alternative 4 includes a new CSAH 55 alignment that has a bridge over the westbound TH 23 on ramp; this alternative would require the CSAH 55 rail grade separation project to be completed concurrently. The required combination of project phases increases the initial project cost by a significant amount. The estimated cost of Alternative 4 is \$13.2 million.

The Alternative 4 - Folded Diamond Interchange B layout can be found in **Figure 8** below.

Figure 8 – Alternative 4 - Folded Diamond Interchange B Layout

Alternative 4 requires that the CSAH 55 railroad grade separation project be constructed at the same time as the interchange project and also requires removal of recent infrastructure investments; therefore, this alternative was not considered reasonable and was dismissed and not analyzed further in this ICE study.

4.1.5 Alternative 5 - Folded Diamond Interchange C

Alternative 5 is a folded diamond interchange where the ramps to and from eastbound TH 23 are on the east side of CSAH 5 and the ramps to and from westbound TH 23 are on the west side of CSAH 5. The westbound TH 23 ramps follow the existing CSAH 5 alignment. The recently constructed southern TH 23 ramp terminal intersection would also need to be relocated in order to accommodate the folded diamond design.

Alternative 5 includes a new CSAH 55 alignment that has a bridge over the westbound TH 23 ramps; this alternative would require the CSAH 55 rail grade separation project to be completed concurrently. The required combination of project phases increases the initial project cost by a significant amount. The estimated cost of Alternative 5 is \$12.7 million.

The Alternative 5- Folded Diamond Interchange C layout is shown in **Figure 9** below.

Figure 9 – Alternative 5 - Folded Diamond Interchange C Layout

Alternative 5 requires that the CSAH 55 railroad grade separation project be constructed at the same time as the interchange project and also requires removal of recent infrastructure investments; therefore, this alternative was not considered reasonable and was dismissed and not analyzed further in this ICE study.

4.2 Warrant Analysis

The Minnesota Manual on Uniform Traffic Control Devices (MnMUTCD) provides guidance on when it may be appropriate to use all-way stop or signal control at an intersection. This guidance is provided in the form of “warrants”, or criteria, and an engineering analysis of the intersection’s design factors to determine when all-way stop or signal control may be justified. Though all-way stop or signal control should not be installed at an intersection unless a MnMUTCD warrant is met, meeting a warrant at an intersection does not in itself require the installation of that particular control type. The particular control type also needs an engineering analysis of the intersection’s design in order for it to be justified. Under the MnDOT ICE process, roundabouts are considered to be warranted if traffic volumes meet the criteria for either all-way stops or traffic signals.

For traffic signal installation, MnDOT typically relies on Warrant 1, which requires 8 hours of combined major approach volumes and the maximum minor approach volume to meet MnMUTCD thresholds based on the number of approach lanes; however, other warrants can be used as indicators of need to consider traffic control change. An engineering study that considers factors, including warrants, should be performed to determine the “optimum” type of control at an intersection.

MnDOT guidelines suggest that for the purpose of warrant analysis, 100% of right turning traffic from the minor leg should be removed because right turners are typically able to enter the traffic stream with minimal delay or conflict; the right turning traffic would not require a traffic signal to reduce delay or improve safety. In certain circumstances (i.e. high right turn volume, minimum mainline gaps, etc.), MnDOT procedures allow for the inclusion of 50% of the minor street right turning traffic in the analysis. The MnDOT guidance states “if right turning volume exceeds 70% of its potential capacity for any hour for each approach, 50% of the right turning volume for all hours should be added back in.”

Based upon MnDOT guidance, the analysis for all intersections in this study include the removal of 100% of the right turning traffic on the minor approaches.

When the speed limit on any of the approaches is greater than 40 mph, MMUTCD guidelines allow using 70 percent of the signal warrant thresholds that would otherwise be required. The speed limit on all of the approaches in the study area are above 40, which allows a 70 percent reduction in signal warrant requirements.

Based on the existing 2017 traffic data and the future 2040 forecast traffic demands:

- None of the study intersections in any of the alternatives meet the all-way stop warrant volume thresholds from the MnMUTCD.
- None of the intersections in any of the alternatives meet the 8-hour, 4-hour, or peak hour traffic signal warrant volume thresholds from the MnMUTCD for any demand scenario.

No all-way stop or signal warrants were met for any of the intersections in any of the alternatives. **Table 4** and **Table 5** provide the number of hours met for the all-way stop and 8-hour traffic signal warrants the 2017 existing and 2040 traffic volume demand scenarios for each of the configuration alternatives. The complete all-way stop and traffic signal warrant analyses can be found in **Appendix C**.

Table 4
All-way Stop Warrant Analysis Results

Intersection	Number of Hours Met (2017 / 2040)			
	No Build**	Alternative 1	Alternative 2	Alternative 3
CSAH 5 at TH 23	0 / 0	n/a	n/a	n/a
CSAH 5 at CSAH 55	0 / 0	0 / 0	n/a	0 / 0
CSAH 5 at TH 23 WB Ramps	n/a	0 / 0	0 / 0	0 / 0
CSAH 5 at TH 23 EB Ramps	N/A*	0 / 0	0 / 0	0 / 0
CSAH 5 at CSAH 5 Bridge	0 / 0	n/a	n/a	0 / 0

*There are no minor road turning movements. Therefore, no warrants can be met.

**The No Build alternative is the 2017 Build/2040 No Build alternative discussed in Section 3

Table 5
8-Hour Traffic Signal Warrant Analysis Results

Intersection	Number of Hours Met (2017 / 2040)			
	No Build**	Alternative 1	Alternative 2	Alternative 3
CSAH 5 at TH 23	N/A***	n/a	n/a	n/a
CSAH 5 at CSAH 55	0 / 0	0 / 0	n/a	0 / 0
CSAH 5 at TH 23 WB Ramps	n/a	0 / 0	0 / 0	0 / 0
CSAH 5 at TH 23 EB Ramps	N/A*	0 / 0	0 / 0	0 / 0
CSAH 5 at CSAH 5 Bridge	0 / 0	n/a	n/a	0 / 0

*There are no minor road turning movements. Therefore, no warrants can be met.

**The No Build alternative is the 2017 Build/2040 No Build alternative discussed in Section 3

***All minor road turning movements are right turns. Therefore, after right turn reductions there are no minor road turning movements and no warrants can be met.

4.3 Safety Analysis

Future vehicular crash estimates were determined by applying crash rates, typical for various intersection types, to entering traffic for the study intersection. The "Existing" estimates are based on the existing crash rates described in Section 2 and are only included to show the safety benefits of the 2017 Build configuration.

The "2017 Build/2040 No Build" estimates are based on the existing crash rates described in Section 2 with crashes removed based on improvements made with the HSIP project. This includes removing crashes involving southbound left turning vehicles, eastbound right turning vehicles, westbound left turning vehicles, and all northbound vehicles for the intersection of CSAH 5 at TH 23. Removing these crashes represents the expected crashes based on existing data for the 2017 build configuration.

The following crash rates were utilized in this analysis:

- Existing (2016 and prior configuration) estimates are based on the existing crash rates described in Section 2. The existing crash rate at the intersection of CSAH 5 and TH 23 is 0.77, and 0.55 at the intersection of CSAH 5 and CSAH 55.
- No Build (2017 HSIP Project) estimates are based on the existing crash rates described above. The existing crash rate at the intersection of TH 23 and CSAH 5 is reduced to 0.23, and 0.55 at the intersection of CSAH 5 and CSAH 55.
- The MnDOT statewide average crash rate for a rural two-way stop controlled intersections is 0.25 crashes per million vehicles entering the intersection.

Table 6 shows the projected number of total crashes for each intersection in each alternative under two-way stop control analyzed for the existing and forecast 2040 traffic conditions. Other forms of traffic control were not evaluated because no all-way stop or traffic signal warrants are met for any intersection in any alternative.

Table 6
2017 and 2040 Annual Crash Estimates

Intersection	Total Crashes (2017 / 2040)				
	Existing	No Build	Alternative 1	Alternative 2	Alternative 3
CSAH 5 at TH 23	1.9 / 2.3	0.4 / 0.5			
CSAH 5 at CSAH 55	0.6 / 0.8	0.5 / 0.7	0.3 / 0.4		0.1 / 0.1
CSAH 5 at TH 23 WB Ramps			0.3 / 0.4	0.3 / 0.4	0.3 / 0.4
CSAH 5 at TH 23 EB Ramps		0.2 / 0.2	0.3 / 0.4	0.3 / 0.4	0.3 / 0.4
CSAH 5/CSAH 15 at CSAH 5 Bridge		0.3 / 0.4			0.3 / 0.4
Yearly Crash Totals	2.5 / 3.1	1.4 / 1.8	0.9 / 1.2	0.6 / 0.8	1.0 / 1.3
Total Conflict Points	41	31	35	45	36

Notes:

Existing crash rate at TH 23/CSAH 5 is 0.77
Estimated crash rate under "No Build" conditions at TH 23/CSAH 5 is 0.23 based on removal of conflict reductions
Existing crash rate at CSAH 5/CSAH 55 is 0.55
All new intersection estimated crashes are based on MnDOT Average Rate of 0.25 for Two-way Stop Conditions

4.4 Operational Analysis

Traffic operations analyses were conducted to determine the level of service (LOS), delay, and queueing information for the AM and PM peak hour conditions for each alternative.

LOS is a qualitative rating system used to describe the efficiency of traffic operations at an intersection. Six LOS values are defined, designated by letters A through F. LOS A represents the best operating conditions (no congestion), and LOS F represents the worst operating conditions (longest delays). For the study intersection it was assumed that LOS D or better represents acceptable operating conditions.

LOS for intersections is determined by the average control delay per vehicle. The range of control delay for each LOS is different for signalized and unsignalized intersections. The expectation is that a signalized intersection is designed to carry higher traffic volumes and will experience greater delays than an unsignalized intersection; driver tolerance for delay is greater at a signal than a stop sign. Therefore, LOS thresholds for each LOS category are lower for unsignalized intersections than for signalized intersections.

The traffic operations analyses were performed using Synchro/SimTraffic (version 9) software; using an average of 5 simulation runs for each modeling result. LOS for intersections is determined by the average control delay per vehicle.

All intersections, for every alternative, were analyzed under two-way stop control as all-way stop and traffic signal warrants are not met by any intersections in any alternative.

Appendix D includes all relevant operational tables for the existing and future 2040 alternatives that follow.

4.4.1 Existing (2017) Operating Conditions

The intersection currently, prior to the HSIP project, operates at LOS A. **Table 7** represents the existing traffic operations under two-way stop control with TH 23 under free flow conditions and CSAH 5 being required to stop.

Table 7
Existing (2017) Operating Conditions

Peak Hour	Intersection	Approach (Delay / LOS)				Intersection (Delay / LOS)
		Eastbound	Westbound	Northbound	Southbound	
AM Peak	CSAH 5 at TH 23	1.3 / A	2 / A	10 / B	5.6 / A	4.1 / A
	CSAH 5 at CSAH 55	1.7 / A		3.2 / A	0.3 / A	2.3 / A
PM Peak	CSAH 5 at TH 23	1.3 / A	2.4 / A	8 / A	6.2 / A	3.4 / A
	CSAH 5 at CSAH 55	1.3 / A		1.8 / A	0.4 / A	1.1 / A

4.4.2 Traffic Control Alternatives

Based on the warrant analysis, all-way stop and traffic signal warrants are not currently met for any intersection in any of the interchange alternatives. Therefore, the analysis will include only two-way stop controlled intersections in all interchange alternatives.

4.4.2.1 2040 No Build (HSIP Build)

The future no build alternative is the 2017 HSIP Project configuration that is currently under construction as described in Section 3.

All of the study intersections would perform at LOS A through the design year 2040. **Table 8** presents the 2040 traffic operations results for the No Build (HSIP Build) alternative.

Table 8
2040 No Build (HSIP Build) Operations

Peak Hour	Intersection	Approach (Delay / LOS)				Intersection (Delay / LOS)
		Eastbound	Westbound	Northbound	Southbound	
AM Peak	CSAH 5 at TH 23	1.5 / A	2.5 / A		2.2 / A	1.9 / A
	CSAH 5 at CSAH 55	2.6 / A		0.9 / A	0.2 / A	1.1 / A
	CSAH 5 at CSAH 5 Bridge	0.7 / A	0.6 / A	1.9 / A		1 / A
	CSAH 5 at TH 23 EB Ramp			0.3 / A	0.5 / A	0.4 / A
PM Peak	CSAH 5 at TH 23	1.1 / A	2.7 / A		2.3 / A	2 / A
	CSAH 5 at CSAH 55	2.7 / A		0.8 / A	0.4 / A	0.9 / A
	CSAH 5 at CSAH 5 Bridge	0.7 / A	0.9 / A	1.6 / A		0.9 / A
	CSAH 5 at TH 23 EB Ramp			0.1 / A	0.3 / A	0.3 / A

4.4.2.2 2040 Alternative 1 (Diamond Interchange)

A diamond interchange was considered for the study area. The turning movement volumes for the diamond interchange were rerouted from the existing configuration and the same growth rates discussed in Section 3 were applied to the rerouted volumes.

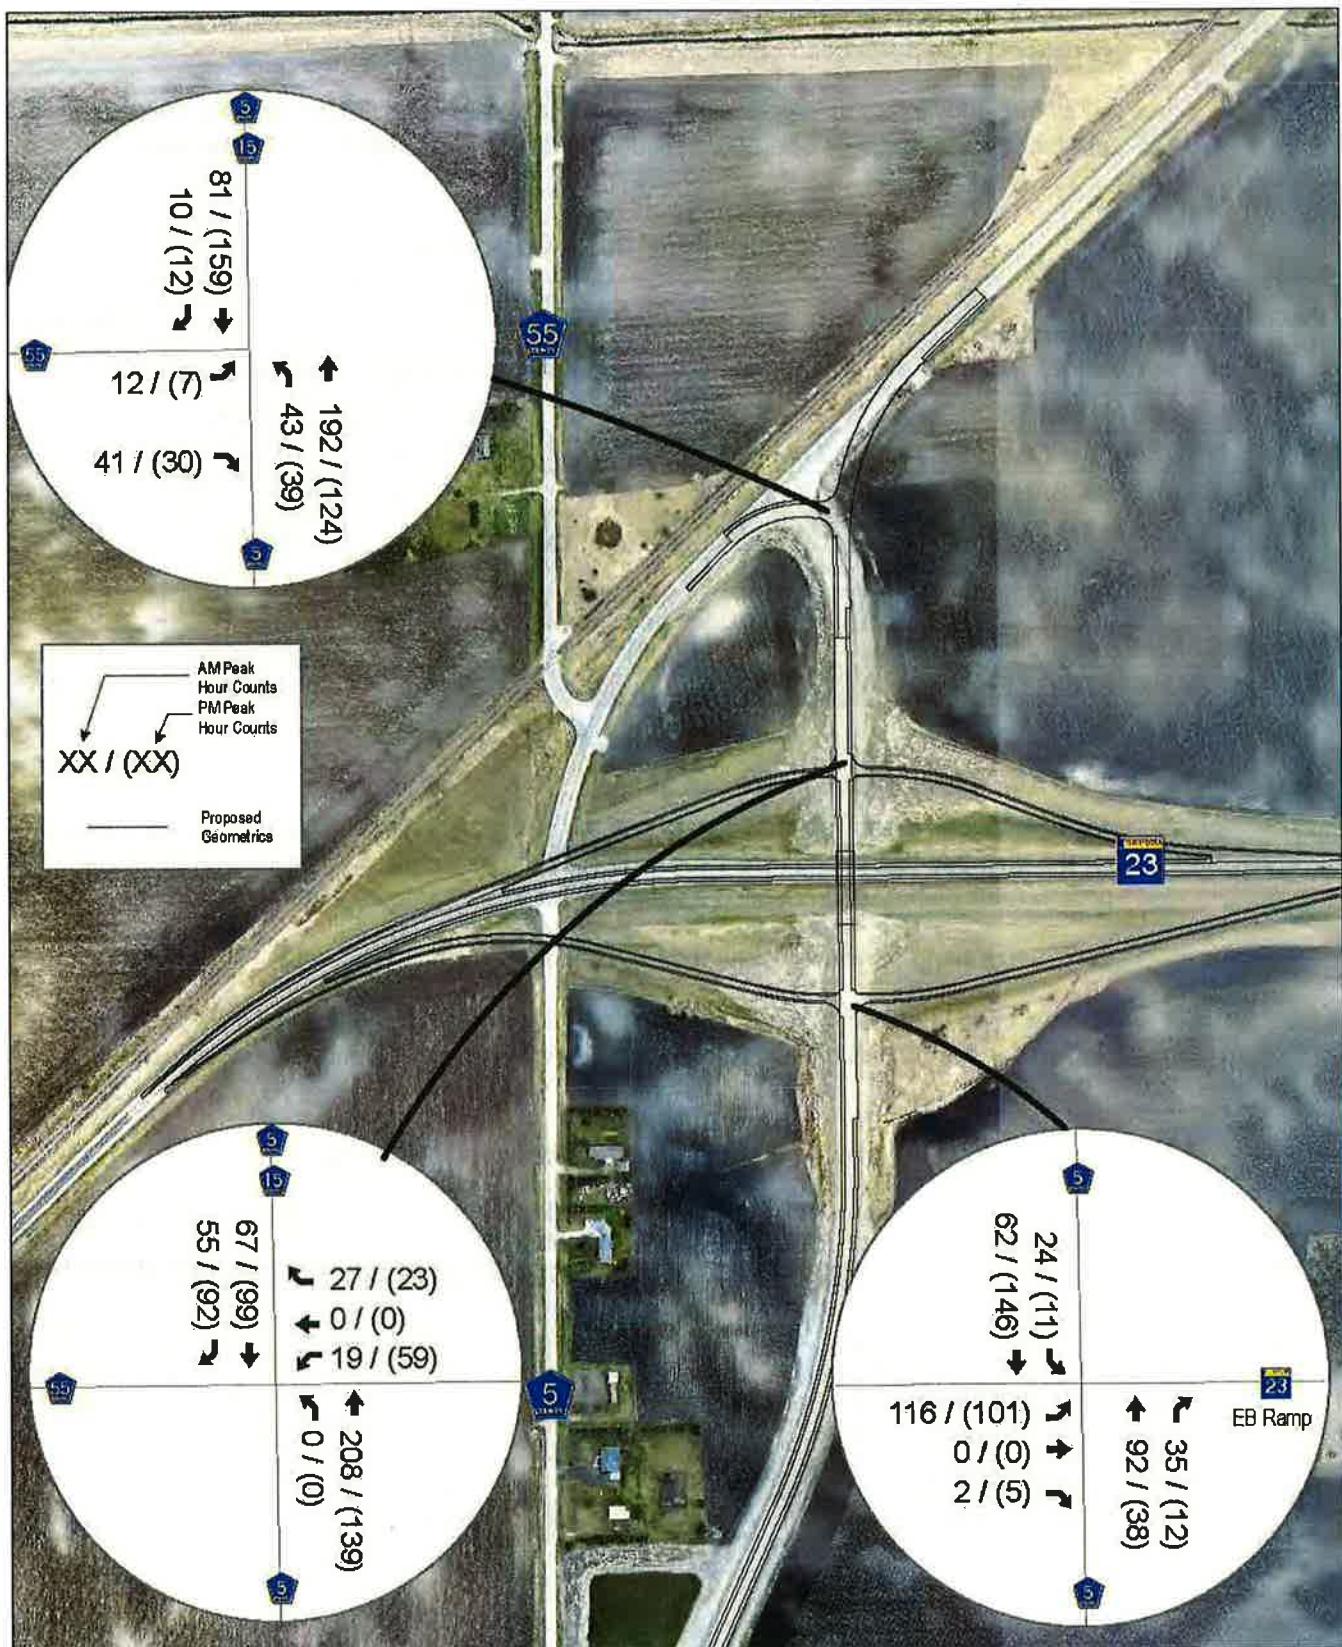

The 2040 turning movement volumes for Alternative 1 are in **Figure 10**.

The diamond interchange would perform at LOS A through the design year 2040. **Table 9** presents the 2040 traffic operations results for Alternative 1 (Diamond Interchange).

Table 9
2040 Alternative 1 (Diamond Interchange) Operations

Peak Hour	Intersection	Approach (Delay / LOS)				Intersection (Delay / LOS)
		Eastbound	Westbound	Northbound	Southbound	
AM Peak	CSAH 5 at CSAH 55	1.6 / A		0.6 / A	0.3 / A	0.7 / A
	CSAH 5 at TH 23 WB Ramps		2.7 / A	0.9 / A	0.2 / A	0.9 / A
	CSAH 5 at TH 23 EB Ramps	4.3 / A		0.7 / A	0.9 / A	1.9 / A
PM Peak	CSAH 5 at CSAH 55	1.9 / A		0.8 / A	0.3 / A	0.7 / A
	CSAH 5 at TH 23 WB Ramps		3.3 / A	0.8 / A	0.2 / A	1 / A
	CSAH 5 at TH 23 EB Ramps	4.1 / A		0.4 / A	0.7 / A	1.9 / A

Figure 10 – 2040 Peak Hour Turning Movement Volumes (Alternative 1)

4.4.2.3 Alternative 2 (Folded Diamond Interchange)

A folded diamond interchange was considered for the study area. The turning movement volumes for the folded diamond interchange were rerouted from the existing configuration and the same growth rates discussed in Section 3 were applied to the rerouted volumes.

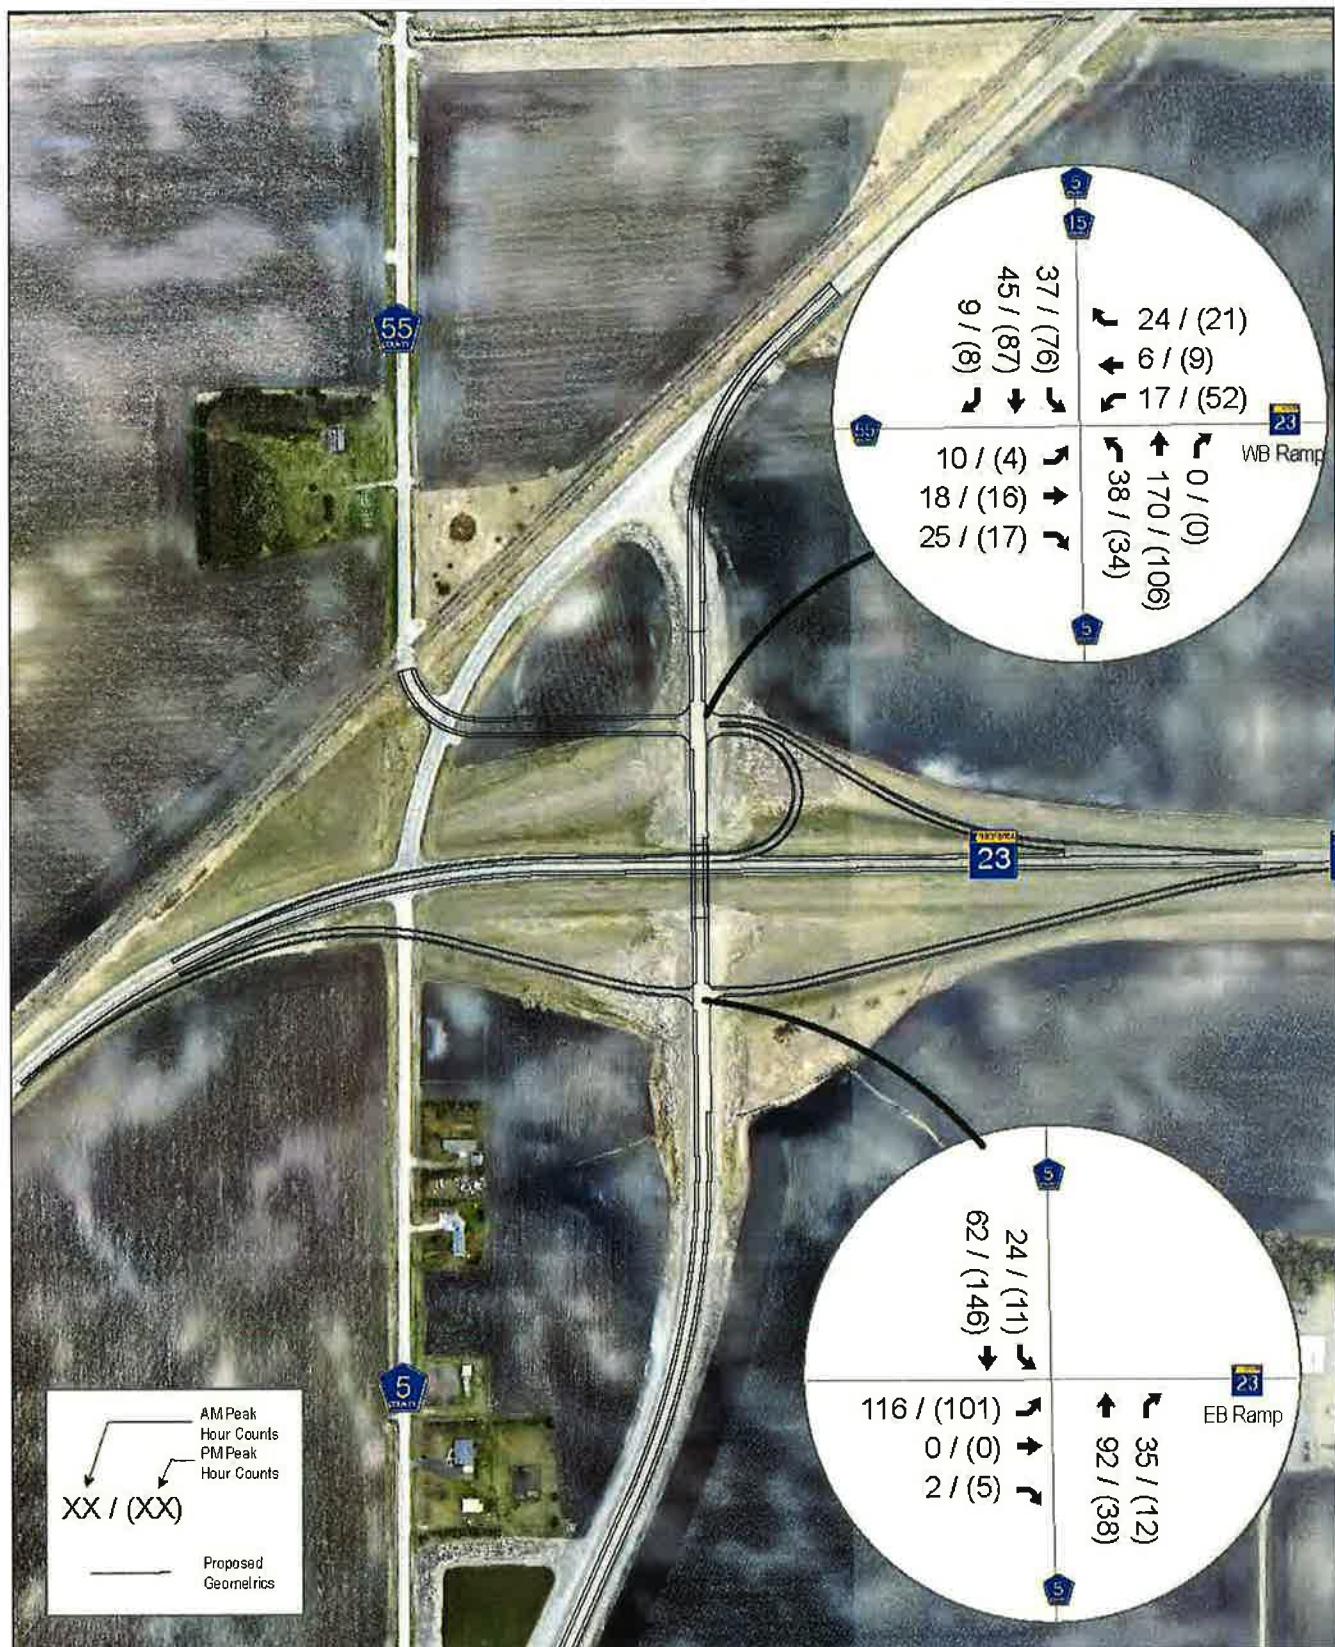

The 2040 turning movement volumes for Alternative 2 are in **Figure 11**.

The folded diamond interchange would perform at LOS A through the design year 2040. **Table 10** presents the 2040 traffic operations results for Alternative 2 (Folded Diamond Interchange).

Table 10
Alternative 2 (Folded Diamond Interchange) Operations

Peak Hour	Intersection	Approach (Delay / LOS)				Intersection (Delay / LOS)
		Eastbound	Westbound	Northbound	Southbound	
AM Peak	CSAH 5 at TH 23 WB Ramps	4.7 / A	3 / A	1.2 / A	0.8 / A	1.8 / A
	CSAH 5 at TH 23 EB Ramps	3.7 / A		0.6 / A	1.2 / A	1.8 / A
PM Peak	CSAH 5 at TH 23 WB Ramps	4.9 / A	4.2 / A	1.4 / A	1.2 / A	2.2 / A
	CSAH 5 at TH 23 EB Ramps	3.9 / A		0.5 / A	1.2 / A	2 / A

Figure 11 – 2040 Peak Hour Turning Movement Volumes (Alternative 2)

4.4.2.4 Alternative 3 (Modified Diamond Interchange)

A modified diamond interchange was considered for the study area. The turning movement volumes for the modified diamond interchange were rerouted from the existing configuration and the same growth rates discussed in Section 3 were applied to the rerouted volumes.

The 2040 turning movement volumes for Alternative 3 are in **Figure 12**.

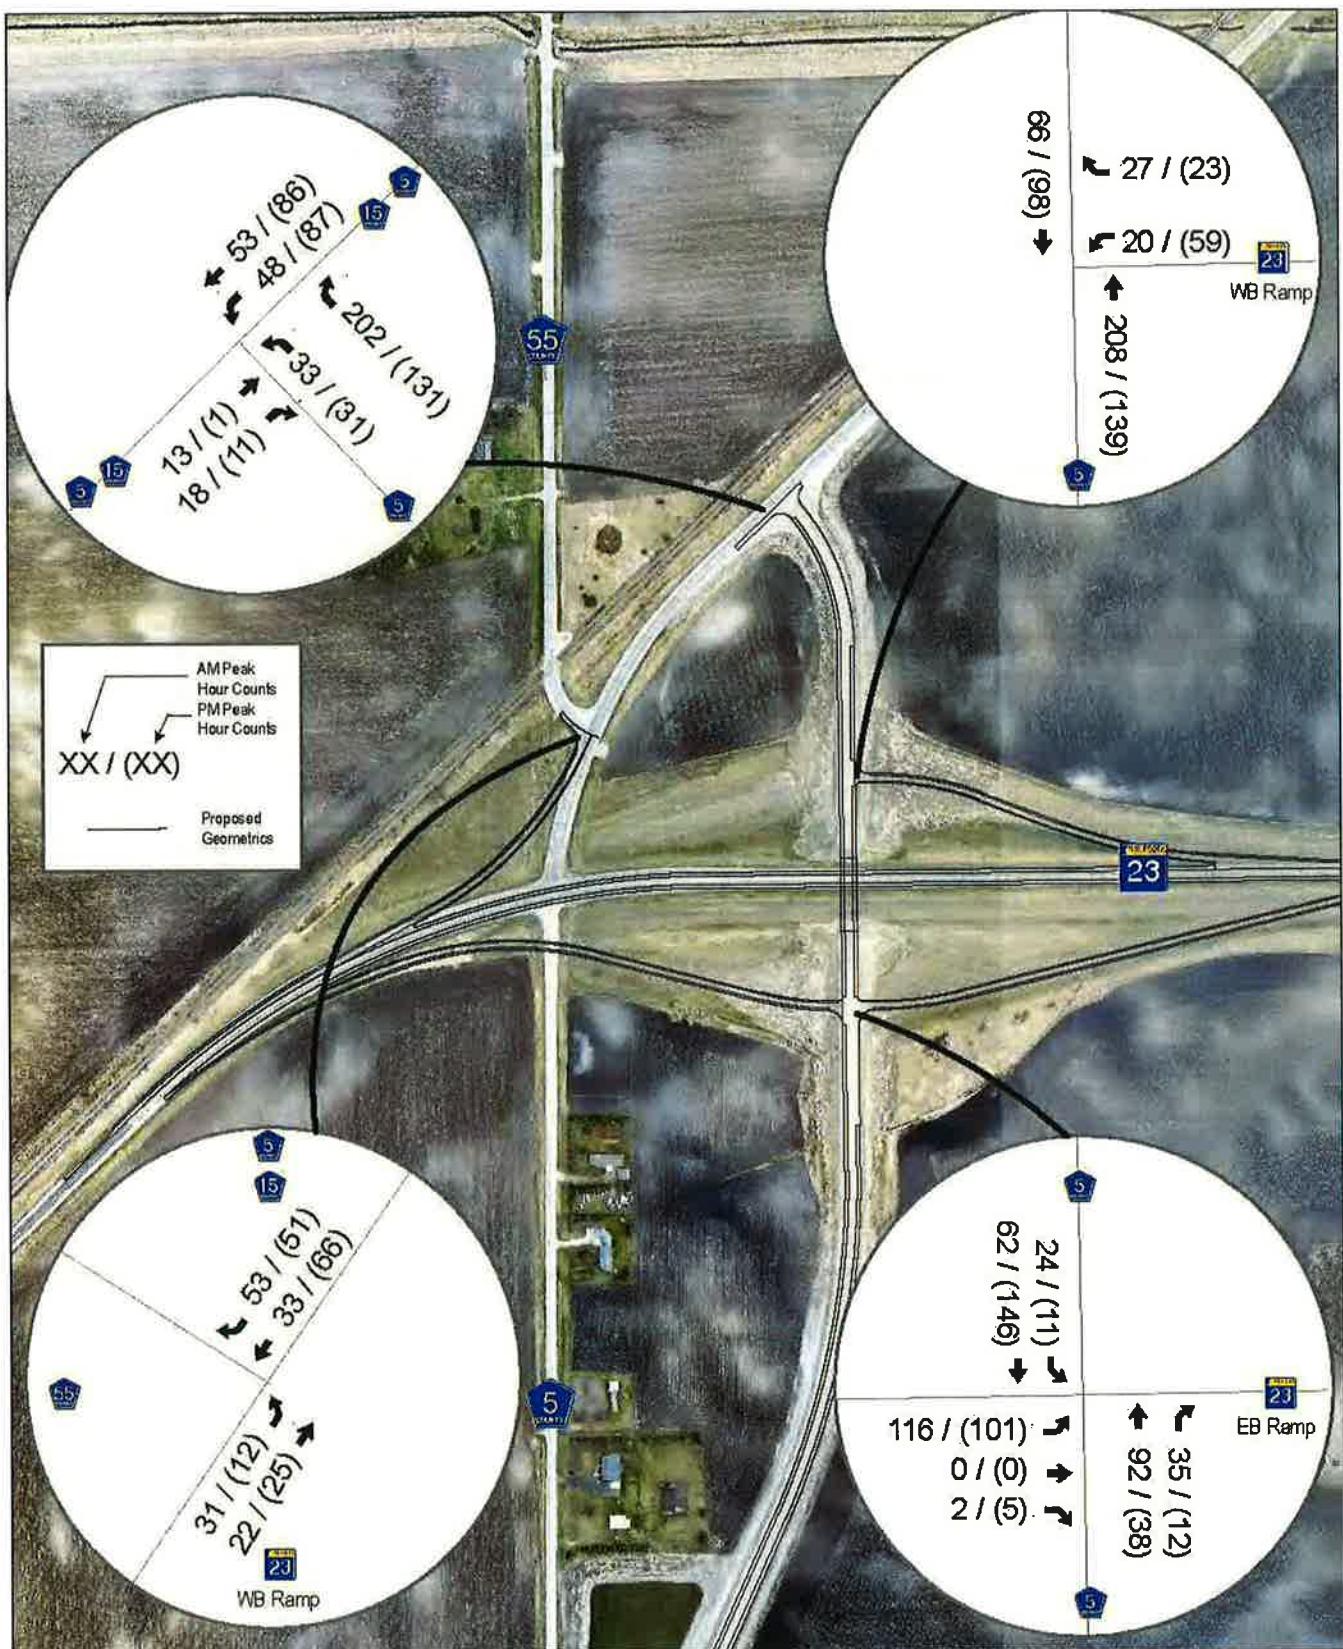

The folded diamond interchange would perform at LOS A through the design year 2040.

Table 11 presents the 2040 traffic operations results for Alternative 3 (Modified Diamond Interchange).

Table 11
Alternative 3 (Modified Diamond Interchange) Operations

Peak Hour	Intersection	Approach (Delay / LOS)				Intersection (Delay / LOS)
		Eastbound	Westbound	Northbound	Southbound	
AM Peak	CSAH 5 at CSAH 55/TH 23 WB Entrance Ramp	2.4 / A			0.2 / A	1.1 / A
	CSAH 5 at CSAH 5 Bridge		2.4 / A	0.8 / A	0.7 / A	1.8 / A
	CSAH 5 at TH 23 WB Exit Ramp		2.5 / A	0.9 / A	1.6 / A	1.3 / A

Figure 12 – 2040 Peak Hour Turning Movement Volumes (Alternative 3)

4.5 Alternative Comparison

All interchange configurations evaluated have both acceptable traffic safety and traffic operations at all of the study intersections. However, not all of the alternatives fully meet the overall project goals as set forth by the agency coordination team. The intent of the interchange alternative designs is to address the following objectives:

- Provide an effective westerly bypass
- Provide good access to the industrial land uses
- Clarity of use for driving public
- Cost effective solutions

The following matrix, **Table 12**, was developed in cooperation with project partners as a method to distinguish the alternatives based on the current project as well as the long term vision of the area.

Kandiyohi County has a long term plan to grade separate CSAH 55 over the railroad and connect to CSAH 5. This would complete the westerly Willmar bypass route. Short Term solutions that are consistent with the long term plan are likely the most cost effective.

4.6 Public Involvement

On July 10, 2017, a presentation was made to the Kandiyohi County Road and Bridge Committee. Interchange alternatives were presented to the committee for discussion. The committee concurred that the standard diamond should be presented to the public as the preferred concept.

On July 27th, 2017, a Public Information Meeting was held at the Kandiyohi County Health and Human Services building. The meeting was in regards to the two projects Kandiyohi County was studying along CSAH 5. In total, 27 people signed in as attending the open house meeting, however there were additional people in attendance who did not sign in.

The meeting provided opportunity for the public to review information boards for both projects. Safety and connectivity issues at the TH 23 and CSAH 5/15 intersection were highlighted in the exhibits. The interchange alternatives were displayed to inform the public on all options considered as part of the study, as well as informational boards regarding the project goals and comparisons of all alternatives.

Based on public input gathered at the meeting as well as from the comment cards that were turned in, the general consensus was that the standard diamond interchange would be an acceptable solution to the safety problem in the project area.

Table 12
Alternative Comparison Matrix

Goals & Objectives	No-Build	Standard Diamond	Modified Diamond	Folded Diamonds		
				A	B	C
Provide an effective westerly bypass						
Improve connection between CSAH 5 & TH 23	0	+	+	+	+	+
Improve intersection performance	-	+	+	+	+	+
Improve safety	-	+	+	+	+	+
Eliminates at-grade railroad crossing	0	+	+	+	+	+
Provide good access to the industrial park						
Improve route via CSAH 55	0	+	+	+	+	+
Improve route via CSAH 5/15	0	+	+	+	+	+
Attracts trucks from other routes	0	+	+	+	+	+
Clarity of use for drivers (not confusing)						
Minimize turns	0	+	+	+	0	0
Intuitive to navigate	0	+	+	+	-	-
Satisfies public expectations	0	+	+	+	-	-
Cost effective solution						
Leverage previous investments (reduce "throw-aways")	0	+	-	-	-	-
Minimizes need for additional R/W	0	+	+	-	-	-
Estimated Cost - \$Millions (Total: Phases 1 & 2)	none	\$10.6	\$11.2	\$10.9	\$13.2	\$12.7

5.0 Summary of Findings

Based on this evaluation, two-way stop control intersections will perform at acceptable levels, LOS A, within any of the CSAH 5 Interchange alternatives through the design year 2040. The intersection control warrant analysis supports these results.

Because all of the interchange alternatives have been shown to have comparable safety and intersection performance, a recommendation will be based on the ability to satisfy the previously identified project goals and objectives.

- Provide an effective westerly bypass
- Provide good access to the industrial land uses
- Clarity of use for driving public
- Cost effective solutions

While all of the alternatives would provide an improved westerly bypass and improved accessibility between TH 23 and industrial land uses, the diamond interchange most fully achieves all of the project goals. The diamond interchange configuration is the most familiar to the general public and therefore best achieves the goal of satisfying driver expectations. In addition, the standard diamond is most cost effective because it leverages the highest level of previously constructed infrastructure and has the lowest overall project cost.

Based on the analysis documented in this report, input from the Agency Coordination Team, as well as input obtained at the public open house, it is recommended that Alternative 1, the standard diamond interchange, best addresses the projects objectives and therefore should be constructed at TH 23 and CSAH 5/15.
